E-Commerce Development

Complete online shopping platforms with product management, orders, customers and payment integration.

Project Overview

A retail business selling through social media pages wanted a proper online store. Orders were being collected through direct messages and tracked by hand, which limited growth and caused frequent mistakes during busy periods.

The Challenge

- Orders arrived through multiple chat channels with no central record.
- Stock levels were not tracked, leading to overselling of popular items.
- Payment collection was manual and reconciliation was time-consuming.
- Customers had no way to check order status, so support load was high.

Our Solution

- Built a full e-commerce platform on Laravel with product, category and variant management.
- Implemented cart, checkout and order lifecycle with clear status tracking for customers.
- Integrated an online payment gateway through REST API with secure callback handling.
- Added real-time inventory deduction so stock cannot be oversold.
- Created an admin dashboard for orders, customers, coupons and sales reporting.
- Optimised product listing and search queries in MySQL for fast browsing.

Technologies Used

Frontend	HTML5, CSS3, JavaScript, Bootstrap, Vue.js
Backend	PHP, Laravel, REST API
Database	MySQL
Dev & Collaboration	Git, GitHub, VS Code, XAMPP

Results

Metric	Before	After
Order processing time	approx. 12 min/order	approx. 2 min/order
Overselling incidents	Regular	Eliminated
Payment reconciliation	Manual, daily	Automated
Order status support queries	High	Reduced sharply

Key Takeaway

The store front is only half of an e-commerce project. Reliable inventory, order state and payment handling behind the scenes are what actually reduce operating cost and make growth manageable.
